INTRODUCTION

This troubleshooting book is designed as a quick reference for carburetion problems and an aid in identifying failures and their possible causes. It also directs the user to other publications and printed material that assist in properly resolving problems or making adjustments not related to carburetion but could affect carburetion.

Listed below are some basic **DO'S** and **DON'TS** to be followed when making carburetor repairs.

PLEASE DO:

Follow all instructions carefully.

Use new service replacement screws (650506 Torx 8) for the choke and throttle shutters (screws are treated with a dry-type adhesive to secure them in place).

Use TecumsehPower float tool 670377 or an 11/64 drill bit to set the proper float height. Remove the bowl gasket and measure from the casting surface. The gasket should be replaced or poor starting may result.

Use only genuine TecumsehPower service parts.

Remove all welch plugs, o-rings and non-metallic main nozzles before cleaning carburetor in cleaner.

DO NOT:

Use drill bits to clean passages.

Enlarge passages.

Soak carburetor in a cleaner over 30 minutes.

Reuse original choke and throttle shutter screws.

Interchange bowl nuts.

Reuse gaskets and "O" rings.

ENGINE TROUBLESHOOTING

When troubleshooting a carburetor, other areas such as valves, fuel tank venting or gaskets should not be overlooked. The carburetor is dependent on the proper operation of the engine to do its job. The first step in troubleshooting is to determine if you have a carburetor or an engine problem.

In order for the engine to operate properly, the following items need to be checked first:

1. Make sure there is a sufficient amount of clean, fresh fuel in the tank.
2. Check spark plug for proper reach, gap and condition. Replace, if needed, or in question. Perform an ignition test using spark tester part number 670366 to assure that you have a crisp spark.

NOTE

On older point ignitions models check for proper ignition timing according to the Technician's handbook.

3. Check for fuel flow restrictions into the carburetor. Deteriorated fuel line, and fuel cap venting are some of the more common restrictions. TecumsehPower uses a stainless steel 75 micron filter screen molded into most tanks. It is extremely rare for this area to become restricted and should be checked last.
4. Check compression by first disconnecting the spark plug lead and ground it to prevent start-up. Next, turn the engine over by hand. A definite resistance should be noticed on the compression stroke. Using a cylinder leak down tester is also possible.

After these basic checks have been performed and you are satisfied with the engine's condition, attempt to start it. If it does not start, remove the spark plug and check its condition. If it is dry, you can assume there is a problem with the carburetor or the fuel system. Continue by troubleshooting the carburetor.

FUEL RECOMMENDATIONS

FUEL

TecumsehPower strongly recommends the use of fresh clean unleaded regular gasoline in all engines. Unleaded gasoline burns cleaner, extends engine life and promotes better starting by reducing build-up of combustion chamber deposits. Reformulated fuels containing no more than 10% Ethanol, 15% MTBE, 15% ETBE or premium gasoline can be used if unleaded regular gasoline is not available. Leaded fuel may be used in countries where unleaded fuel is not available. **NEVER USE FUEL CONTAINING METHANOL.**

STORAGE

IF THE ENGINE IS TO BE UNUSED FOR 30 DAYS OR MORE

WARNING Gasoline (Fuel) vapors are highly flammable and can explode. Fuel vapors can spread and be ignited by a spark or flame many feet away from the engine. To prevent injury or death from fuel fires, follow these instructions:

- Never store the engine with fuel in the fuel tank inside a building with potential sources of ignition such as hot water and space heaters, clothes dryer, electric motors, etc.

Gasoline can become unstable in less than 30 days and form deposits that can impede proper fuel flow and engine operation. To prevent deposits from forming, all gasoline must be removed from the fuel tank and the carburetor. An acceptable alternative to removing all gasoline is adding a fuel stabilizer such as TecumsehPower Ultra-Fresh part number 730245 to the gasoline. Fuel stabilizer should be added to the fuel tank or storage container. Always follow the mix ratio found on the stabilizer container. Run the engine at least 10 minutes after adding the stabilizer to allow it to reach the carburetor.

Draining the Fuel System

WARNING Do not attempt to pour fuel from engine or siphon fuel by mouth. Empty fuel tank by using a commercially available suction device designed for use with gasoline. Then run the engine until any remaining fuel is consumed. Doing so may result in death or serious injury.

CAUTION Drain the fuel into an approved container outdoors, and away from any open flame or combustion source. Be sure the engine is cool.

NOTE

If gasohol has been used, put a small amount of unleaded gasoline into fuel tank and repeat preceding instructions, then run engine until fuel is used up.

Oil Cylinder Bore

1. Remove the spark plug wire from the spark plug. NOTE: Always ground the plug wire when disconnected. Pull the starter handle slowly until resistance is felt from compression pressure, then stop. Slowly release starter tension to prevent the engine from reversing due to compression pressure.
2. Remove the spark plug, squirt 1/2 ounce (15 ml.) of clean engine oil into the spark plug hole.
3. Cover the spark plug hole with a shop towel and crank the engine over slowly, several times.
4. Replace the spark plug and tighten. Pull the starter handle as performed in step #1. The piston position blocks the cylinder ports on 2 cycle engines or closes the valves on 4 cycle engines, preventing air from entering and oil from leaving the cylinder bore during storage.
5. Re-connect the spark plug wire on the spark plug.

HIGH ALTITUDE JET FOR EMISSIONIZED CARBURETORS

The following list of altitude compensation jets is being provided for use with emission grade carburetors at elevations between 6,000 and 11,000 feet (1,824 - 3,344 meters).

This list applies only to engines which are identified as compliant with CARB (California Air Resource Board) or EPA US Environmental Protection Agency regulations.

To determine the proper jet for your carburetor, simply locate the number stamped into the original bowl nut. Then use the chart below to identify and install the proper jet.

NOTE: Installation of altitude compensation jets is **NOT WARRANTY**

STANDARD JET NUMBER	SERVICE NUMBER	USE	HIGH ALT. JET BETWEEN 6,000 TO 11,000 FT (1,824 TO 3,455 M)	SERVICE NUMBER
148	640181		203	640206
152	640011		183	640114
157	640032		169	640087
158	640008		175	640062
162	640024		149	640185
166	640015		158	640008
176	640059		170	640089
181	640106		167	640188
183	640114		184	640128
184	640128		206	640209
188	640170		163	640187
190	640163		152	640011
191	640162		158	640008
202	640184		205	640186
205	640208		203	640206
206	640209		148	640181
207	640210		206	640209

HIGH ALTITUDE CARBURETOR KITS FOR FIXED MAIN CARBURETORS

NOTE

This list applies only to products built prior to emissions regulation. Engines which are identified as compliant with CARB (California Air Resources Board) or EPA (US Environmental Protection Agency) regulations can NOT be changed from their factory setting unless specifically authorized.

Engines built to O.E.M. specifications may experience starting and operating problems when used in areas where the altitude is 4,000 feet (1220 meters) above sea level or higher. A leaner fuel/air mixture is desirable at higher elevations to sustain good engine startability and operating characteristics. Engines built with adjustable idle and main circuit carburetors can be adjusted to optimize performance.

The following will assist you in selecting the correct high altitude/leaner jetted bowl nut for engines equipped with fixed main or dual system carburetors. Order parts from your Authorized Tecumseh Power Distributor or Dealer.

4 CYCLE

ENGINE	STANDARD BOWL/NUT STAMPED	Over 4,000 Ft.
TVS90-120/ECV90,100/TNT100	64, 65, 75, 79, 103,- 108, 126, 127, 137	632455
TVS90-120 / OHH50 / 55	158, 161, 164, 165, 166, 171, 172, 177	632737
TVS90 -120, OVRM40-60	124, 125, 133, 135, 136	631026
OVV & OVXL120, OHV11-13 (Formula)	120, 141	632239
Dellorto	69	633017
VLV40, 50, 55, 60	Jet	632648
VLV40, 50, 55, 60	Nozzle	632638
TVM170-195	83, 132	632239
TVM220	109, 131	631973
OHV15 - Walbro LMK26	Jet	632688

2 CYCLE

AH/AV520 & 600, HSK600	101	632368
TVS/TVXL840	L118, L119	632463
HSK840, 845, 850/HXL840	124, 125	631026
TC200/TC300 Tillotson carburetor only.	Jet	632940
TC200/TC300 Tillotson HU112 and HU114	Jet	N/A

Do not install leaner jetted bowl nuts on engines used below four thousand feet as starting and operating problems will occur. **DOING SO WILL VOID THE ENGINE WARRANTY.**

THROTTLE CONTROL BRACKETS, GOVERNORS AND RPM ADJUSTMENTS

Before adjusting any mixture screws, reset the screws to the recommended carburetor presets. Check for proper governor adjustments as outlined in the appropriate Technician's Handbook. Identify the locations of your high speed and low speed RPM adjustment screws. Check to make sure that the throttle control brackets are adjusted properly to allow for full choke. Always make sure that normal maintenance procedures (ie., oil, fuel, air cleaner, etc.) have been checked. Consult microfiche card #30, the computer parts look up system or Service Bulletin #107 for C.P.S.C. specifications to determine the proper RPM settings. Start the engine, allow it to warm up, the carburetor can then be adjusted for optimum performance by using the information outlined in this book. Now the low and high speed screws can be adjusted to the recommended RPM's.

HOW TO IDENTIFY A TecumsehPower CARBURETOR

TecumsehPower has a variety of carburetors. To help identify these carburetors here are some simple procedures to follow.

DUAL SYSTEM CARBURETORS

The easiest way to identify the dual system carburetor is by the presence of a large primer bulb located on the side of the carburetor. The absence of adjustment needles help to identify the carb as well. The dual system carburetor is used on 4-cycle vertical crankshaft rotary mower engines.

SERIES 1 CARBURETORS

Series 1 carburetors come in a variety of styles. They are used on both 2 and 4-cycle vertical and horizontal shaft engines in the 2 through 7 h.p. range. It is a float style carburetor with a smaller venturi than the Series 3 and 4 carburetors. Some will have an adjustable idle and main and others will have a fixed main with an adjustable idle. There are also some fixed speed applications that will only have a fixed main system and the idle system will not be drilled.

SERIES 1 EMISSION

This carburetor is similar to the standard Series 1 carburetor. The emission equivalent has a fixed idle and main. The idle restrictor jet will be capped to prevent access unless the cap is removed. The fixed main jet is part of the bowl nut. A ball plug is visible from the bottom, which seals the passage. This carburetor also has a serviceable main nozzle emulsion tube.

HOW TO IDENTIFY A Tecumseh Power CARBURETOR

(CONTINUED)

SERIES 2 CARBURETORS

Series 2 carburetors were used on outboard engines. This carburetor is the same as the Series 1 with the exception of the remote adjustable idle mixture screw, and a built in fuel pump.

Series 2 carburetors have a built-in fuel pump consisting of a fuel pump element which inflates and deflates with crankcase pulsations which opens and closes two flap valves in the fuel pump, thereby pumping fuel from a remote tank to the carburetor float bowl.

When replacing the fuel pump element, install with the slot opening at a 45° angle as illustrated. Installation in any other position will damage the diaphragm.

SERIES 3 & SERIES 4 CARBURETORS

Series 3 and 4 carburetors are generally used on 8 through 12.5 horsepower 4-cycle engines. The venturi size of these carburetors are larger than Series 1 and Dual System Carburetors. The quickest way to identify these carburetors is by the presence of bosses on each side of the idle mixture screw.

SERIES 3 & SERIES 4 EMISSION

This carburetor is similar to the standard Series 3 & 4 carburetor with a few subtle differences. The emission equivalent has a fixed idle and main. The idle restrictor jet will be capped to prevent access unless the cap is removed. The fixed main jet is part of the bowl nut. A ball plug is visible from the bottom, which seals the passage. This carburetor also has a serviceable main nozzle emulsion tube.

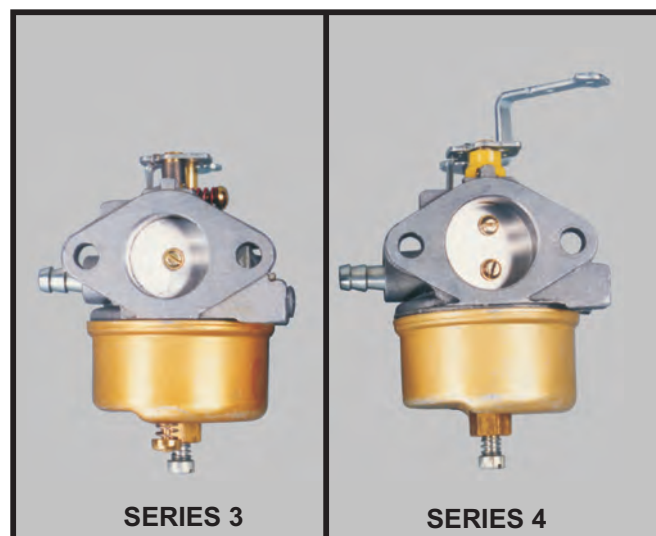

HOW TO IDENTIFY A TecumsehPower CARBURETOR

(CONTINUED)

To determine whether the carburetor is a Series 3 or Series 4, look at the throttle or choke end of the carburetor.

Series 3 will have one screw on the throttle and choke plates.

The Series 4 will have two screws on the throttle and choke plates.

VECTOR CARBURETORS

The Vector carburetor is a float feed, nonadjustable carburetor, with a one piece extruded aluminum body. The float bowl, float, nozzle, and venturi are nonmetallic, which eliminates the corrosion and varnishing problems associated with similar metallic parts. Common service areas of the carburetor are contained in the fuel bowl, which include the float, needle, seat and main nozzle emulsion tube. All of these parts can be serviced without removing the carburetor body from the engine.

NOTE

If the unit was run with poor filter maintenance the venturi should be removed and the air bleeds cleaned with solvent.

SERIES 6 CARBURETORS - 4 CYCLE

Series 6 carburetors are used on 2 and 4-cycle engines. They have a larger venturi than the dual system carburetor and use a simple fixed idle system. Series 6 carburetors used on both vertical and horizontal applications are nonadjustable. The 4-cycle version pictured has a stepped primer bulb.

HOW TO IDENTIFY A TecumsehPower CARBURETOR

(CONTINUED)

SERIES 6 CARBURETORS - 2-CYCLE

Series 6 carburetors used on TVS/TVXL840 engines are similar in appearance and operation to the carburetors used on 4-cycle engines with the following differences:

1. The bowl nut is left-hand thread. This bowl nut is identified by an "L" stamped on the nut and the international left thread notches across the points.
2. A dampening spring is installed on the float hinge pin to reduce erratic float travel.
3. The two mounting bosses extend out from the carburetor body.

SERIES 7 CARBURETORS (EMISSION)

The Series 7 carburetor is an emissions grade carburetor used on medium frame vertical shaft overhead valve engines. It has a non-metallic bowl and a snap-on bowl retainer to connect it to the carburetor body. This model has a fixed main jet and a fixed idle jet; both are located in the carburetor bowl. The float bowl, float, nozzle, and venturi are non-metallic, which eliminates the corrosion and varnishing problems associated with similar metallic parts. Common service areas of the carburetor are contained in the fuel bowl, which include the float, needle, seat and main nozzle emulsion tube. All of these parts can be serviced without removing the carburetor body from the engine.

SERIES 8 CARBURETOR (EMISSION)

The Series 8 carburetor has both a fixed main and idle circuit. The fixed idle system is achieved by a restrictor jet that meters the fuel for the idle circuit. The idle restrictor jet will be capped to prevent access unless the cap is removed. The fixed main jet is part of the bowl nut. A ball plug is visible from the bottom, which seals the passage. This carburetor also has a serviceable main nozzle emulsion tube. It also has a stepped primer bulb.

HOW TO IDENTIFY A TecumsehPower CARBURETOR

(CONTINUED)

SERIES 9 CARBURETOR

The Series 9 carburetor is an emissions carburetor that uses the same carburetor body as the Series 8 but with a simple fixed idle system, identical to the one used on the Series 6 carburetor. It has the idle discharge port located at the 7 o'clock position on the throttle end of the carburetor. Identify this carburetor by the stepped primer bulb, the presence of a non-drilled idle mixing well and a serviceable main nozzle emulsion tube.

SERIES 10 (EMISSION)

The Series 10 carburetor is identical to the Series 8 carburetor with the addition of a choke. To assist in cold weather starts. It has a fixed idle and main. The idle restrictor jet will be capped to prevent access unless the cap is removed. The fixed main jet is part of the bowl nut. A ball plug is visible from the bottom, which seals the passage. This carburetor also has a serviceable main nozzle emulsion tube. It also has a stepped primer bulb to assist in starting.

SERIES 11

This carburetor adds a fuel chamber, built into the carburetor body, that feeds fuel into the venturi during the initial warm up period. This patented feature eliminates, hunting, surging and false starts inherent to emissions engines. However external identification of the Series "11" carburetor has been a challenge. To make this ID simple, the Series "11" carburetor idle restrictor cap will be black, and all others will be gray. The part number for the black cap is **640200** and the gray is **640053**.

SERIES 11 BRIDGED

This carburetor is identical to the Series "11" with the exception of the center leg. A non-metallic jet is pressed into the center leg to allow additional fuel into the main jet for applications that require this fuel to enhance run performance

CARBURETOR CLEANING - SERIES 11 and SERIES 11 BRIDGED

With the additional fuel well welch plug removed, you can see the small plastic metering jet, which can be distorted if left to soak in a carb dip tank. Currently, this metering jet is not a serviceable part. Our position has been to soak a carburetor no more than 1/2 hour but the exception is the Series 11 carburetor. To be safe, service all TecumsehPower carburetors with Carburetor Spray # **696410** along with a .012" (.304 mm) gauge wire.

NON-TecumsehPower CARBURETORS

DELLORTO CARBURETOR

The Dellorto carburetor is similar to the dual system carburetor. It has no adjustments and has a primer assist start. It has a noncorrosive float and the needle is viton tipped, eliminating the viton seat found in the dual system carburetor. The angle of the fuel inlet is adjustable and attached to the carburetor body with a banjo bolt. This carburetor is used on some TVS rotary lawnmower engines.

WALBRO LMK CARBURETOR

The Walbro LMK has a large venturi and a fixed main with an adjustable idle. It is used on some OHV engines. This carburetor has a noncorrosive float and a viton tipped needle. It also has a nonmetallic choke shaft. It is easily identified by the Walbro name on the carburetor body next to the idle adjustment screw.

WALBRO WHG CARBURETOR

The WHG, used on OH cast iron engines, can be built as a fully adjustable, single adjust or nonadjustable carburetor. It has a large venturi. Its most recognizable feature is the large square mounting surface on the choke end of the carburetor.

DIAPHRAGM CARBURETORS

DIAPHRAGM CARBURETORS

The diaphragm carburetors are unique. These carburetors can be operated at a more severe angle than float style carburetors. They still require that the fuel supply be located in a position that allows it to be gravity fed. Its most distinctive feature is the lack of a fuel bowl.

DIAPHRAGM CARBURETORS

(CONTINUED)

WTAWALBRO CARBURETOR

The WTA carburetor has a rubber-type diaphragm, which is exposed to intake pressure on one side and to atmospheric pressure on the other. The WTA is used on TC200 and 300 engines. There are two adjustment screws. They are the idle mixture screw and the idle RPM screw. The WTA has a choke and an all metal fuel inlet fitting. The Walbro name is molded onto the pump cover.

WT WALBRO CARBURETOR

The WT Walbro carburetor is used on the TC-II style engine. It is similar to the WTA carburetor but its reverse image. The WT has no choke lever and has a combination plastic and metal fuel inlet fitting.

TILLOTSON HU CARBURETOR

The Tillotson HU carburetor is the reverse image of the WTA Walbro carburetor. It is used on the TC-II. The Tillotson HU has a replaceable main and Tillotson is visible on the pump cover.

TecumsehPower TC CARBURETOR

This carburetor has a fixed idle and main which meets the emissions standards for two cycle engines. The main jet is serviceable and can be accessed by removing the plastic cap. The jet is removed for cleaning purposes only, and must be covered after servicing to maintain compliance with emissions regulations.

CARBURETOR CLEANING SERIES 8 - 11

1. Remove bowl and push the float hinge pin out with carb tool part # 670377. The float cannot be rotated upward.

2. Remove the seat with the carb tool.

3. Remove the emulsion tube by gently inserting the carb tool. Rotate the hook end until you locate the air bleed passage. Then with hook in place, pull the tube out.

4. Remember there are two "O" rings on the emulsion tube. You may have to go into the center leg a second time to remove the upper second "O" ring.

CARBURETOR CLEANING SERIES 8 - 11

(CONTINUED)

5. Remove the extended prime well welch plug with a sharpened chisel. When piercing through the extended prime well welch plug, pound close to the red primer bulb side as not to mar the casting.

6. Clean the extended prime well w/.012" tag wire and carb spray.

7. Remove the idle prime well welch plug. Using a sharpened chisel or punch. Clean the progression holes and the idle air bleed hole using tag wire and carb spray. If damage occurs in progression holes, replace with a new carburetor.

8. Remove the idle restrictor cap and clean the idle jet with tag wire and carb spray.

CARBURETOR CLEANING SERIES 8 - 11

(CONTINUED)

9. Clean the idle circuit fuel pick-up located in the center leg using tag wire.

10. The Series 11 bridged carburetor has an additional idle circuit fuel pick-up jet on the side of the center leg. Clean this with .012" (.3 mm) tag wire.

11. Clean main jet (bowl nut) with tag wire. Remember there are three drilled passages. The fuel pick-up, the main jet and the idle delivery hole.

12. Spray all cavities with TecumsehPower carburetor spray part # 696410.

CARBURETOR CLEANING SERIES 8 - 11

(CONTINUED)

13. Replace the welch plugs included in carb kit with a flat punch and apply fingernail polish to the edge where the plug meets the casting.

14. Note that a seat has a grooved end (shown) which is installed first into the carburetor casting.

15. Install seat into the orifice with the carb tool until it bottoms on the casting.

16. Check the float height with the carb tool. When the carb tool is removed, the float should remain in position. The dimension of the carb tool flats are 11/64".

CARBURETOR CLEANING SERIES 8 - 11

(CONTINUED)

17. Adjust the float if necessary by bending the metal tang.

18. Bring the float/needle assembly down into position, then insert the float hinge pin.

Always remember the open end of the needle clip on a TecumsehPower carburetor, faces out toward the air cleaner side.

19. Install a new float bowl, bowl "O" ring, and the bowl nut with a new bowl nut gasket.

EMISSION CARBURETORS

The following information will help you better identify some of the common components of emission grade carburetors. Emission carburetors will be internally vented. On the Series 7, 8, 9, 10, 11 and 11 Bridged the atmospheric vent hole is increased in size from earlier model carburetors. This passage way leads to the atmospheric vent chamber which is double vented into the bowl cavity. This double venting is common on emissions grade carburetors.

NOTE

Emissions certified parts can be identified by a specific series of numbers. Emissions carburetors and carburetor parts will be identified using a 640,000 and higher series number. Engine parts that are emissions certified will carry a 40,000 and higher series number.

The fuel metering jets are fixed on both the idle and high speed circuit. The bowl nut on the Series 1, 3, 4, 8, 9, 10 and 11 and 11 Bridged are drilled from the bottom and plugged for the main. The Vector and the Series 7 carburetors use a non-metallic jet held in place by the bowl drain screw to meter fuel for the main.

NOTE

The Series 9 carburetor becomes emission compliant when used on a fixed speed rotary mower application.

The idle on the Series 8 is metered using a threaded restrictor (See illustration). Proper torque of this screw is critical and should be torqued to 5-8 in. lbs. or .5 to 1 nm. If it is not, it may vibrate loose. When the restrictor is placed in the idle circuit passage it is capped with a tamper resistant plastic cap. **Tampering is considered the rejetting or modification through resizing of the jet.** If the jet is removed for cleaning it must be recapped to prevent tampering when it is re-installed. On the Vector and Series 7, a small brass jet in the center leg idle passage in the bowl is used to meter fuel for the idle.

The throttle shutter will have a coined edge or a fine blank edge for improved sealing capabilities. The scribe mark must always face out. The position of the mark is determined by engine size (page 31).

Emissions carburetors will have a serviceable plastic main nozzle emulsion tube. This tube is sealed on both ends using "O" rings or a gasket. These components are critical to the emission grade engine in obtaining repeatable emissions certification. The gasket used on the Series 7 and Vector carburetors acts as a seal and is used instead of an "O" ring.

PRE-SETS AND ADJUSTMENTS (NON-EMISSION)

TecumsehPower CARBURETORS Pre-sets and Adjustments

Engine Model	Main Pre-set	Idle Pre-set
All models with float -type carburetors	1-1/2 turn	1 turn
All models with diaphragm-type carburetors	1 turn	1 turn

MAIN AND IDLE PRE-SETS

Turn both main and idle mixture adjusting screws in (clockwise) finger tight. (CAUTION: Over-tightening will damage the taper portion of the needle.) Then back the screws out (counterclockwise) to the pre-set figure in the chart shown above.

NOTE

Some carburetors have fixed main jets. The absence of the adjusting screw indicates a fixed jet and no adjustment is necessary.

NOTE

Series1 carburetors are built with one of two different styles of adjustment needle for the idle. The long needle is used on air adjust systems. The short needle on fuel adjust systems. The adjustments are the same for both systems, however, the drop off point may not be as noticeable.

FINAL ADJUSTMENTS (MAIN)

Start the engine and allow it to warm up to normal operating temperature (3-5 minutes). Set the speed control to HIGH or FAST position, then turn the main mixture adjustment screw in (clockwise) slowly until the engine begins to run erratic. Note the position of the screw. Now, turn the screw out (counterclockwise) until the engine begins to run erratic. Turn the screw in (clockwise) midway between these two positions. This will be the best setting.

Set the speed control to the IDLE or SLOW position check for proper IDLE or LOW speed RPM and adjust the idle mixture screw in the same manner as the main mixture screw.

If further adjustment is required, the main adjustment should be made with the engine under a loaded condition.

CAUTION Never operate the engine with covers or guards removed. Rotating parts can cause severe injury. Keep hands, feet, hair, jewelry and clothing away from all moving parts.

Engage the driven equipment (cutter deck, impeller, etc.) so as to put the engine under a load condition. If the engine stops or hesitates while engaging the load (lean), turn the main mixture adjusting screw out (counterclockwise) 1/8 turn at a time, testing each setting with the equipment under load, until this condition is corrected.

If the engine smokes excessively (rich), turn the main adjusting screw in (clockwise), 1/8 turn at a time, testing each setting with the equipment under load, until this condition is corrected.

After the main mixture is set, move the speed control to the IDLE or SLOW position. If the engine does not idle smoothly, turn the idle mixture screw 1/8 turn either in (clockwise) or out (counterclockwise) until engine idles smoothly.

Recheck your HIGH and LOW RPM settings and adjust as necessary.

PRE-SETS AND ADJUSTMENTS

(CONTINUED)

RPM ADJUSTMENTS

Now, the LOW and HIGH speed screws can be adjusted to the recommended RPM's. First identify the location of both HIGH and LOW speed RPM adjustment screws, then identify the recommended HIGH and LOW RPM settings according to microfiche card 30, the computer parts look-up system or Service Bulletin #107 for rotary mowers.

GOVERNED / NON-GOVERNED IDLE

With the engine running at the lowest speed set the governed idle at the designated RPM by bending the idle RPM tab. Next set the non-governed idle by pushing the bottom of the governor lever away from the control brackets, so the throttle lever contacts the idle speed screw. Hold the lever in this position and turn the idle adjustment screw clockwise to increase or counterclockwise to decrease engine idle speed. The setting on the carburetor screw should be set 600 RPM below the tab or governed idle setting.

WALBRO CARBURETORS 4 CYCLE PRE-SETS AND ADJUSTMENTS

Carburetor Model No.	Main Pre-set	Idle Pre-set
LMH	1-1/2 turn	1-1/2 turn
WHG & LME	1-1/4 turn	1-1/4 turn
LMK FIXED	1 turn	

MAIN AND IDLE PRE-SETS

Turn both the main and idle mixture adjusting screws in (clockwise) finger tight. (CAUTION: Over-tightening will damage the tapered portion of the needle.) Now back the screws out (counterclockwise) to the pre-set figure in the chart shown above.

NOTE

Some carburetors have fixed main jets. The absence of the adjusting screw indicates a fixed jet and no adjustment is necessary.

FINAL ADJUSTMENTS

Start the engine and allow it to warm up to normal operating temperature (3-5 minutes). Set the speed control to HIGH or FAST position, then turn the main mixture adjustment screw in (clockwise) slowly until the engine begins to run erratic (lean). Note the position of the screw. Now turn the screw out (counterclockwise) until the engine begins to run erratic (rich). Turn the screw in (clockwise) midway between these two positions. This will be the best setting.

Set the speed control to IDLE or SLOW position and adjust idle mixture screw in the same manner as the main mixture screw.

Now the LOW and HIGH speed governor adjustment screws can be set to the recommended RPM's. First identify the location of both HIGH and LOW speed governor adjustment screws, then identify the recommended HIGH and LOW RPM settings according to microfiche card 30.

If further adjustment is required, the main adjustment should be made under a load condition.

CAUTION Never operate the engine with covers or guards removed. Rotating parts can cause severe injury. Keep hands, feet, hair, jewelry and clothing away from all moving parts.

Engage the driven equipment (cutter deck, impeller, etc.) so as to put the engine under a loaded condition.

If the engine stops or hesitates while engaging the load (lean), turn the main mixture adjusting screw out (counterclockwise) 1/8 turn at a time, testing each setting with the equipment under load until this condition is corrected.

If the engine smokes excessively (rich), turn the main adjusting screws in (clockwise) 1/8 turn at a time, testing each setting with the equipment under load, until this condition is corrected.

After the main mixture is set, move speed control to the IDLE or SLOW position. If the engine does not idle smoothly, turn the idle mixture screw 1/8 turn either in (clockwise) or out (counterclockwise) until engine idles smoothly.

Recheck your HIGH and LOW RPM settings and adjust as necessary.

PRE-SETS AND ADJUSTMENTS (CONTINUED)

WALBRO CARBURETORS 2-CYCLE PRE-SETS AND ADJUSTMENTS

Carburetor Model No.	Main Pre-set	Idle Pre-set
WTA&WT	FIXED	1-1/4 turns

TILLOTSON CARBURETOR 2-CYCLE PRE-SETS AND ADJUSTMENTS

Carburetor Model No.	Main Pre-set	Idle Pre-set
HU	FIXED	1-1/2 turns

IDLE PRE-SET

Turn idle mixture adjustment screw (clockwise) finger tight to closed position, then turn the screw (counterclockwise) according to the above chart. This setting will allow engine to be started so carburetor can be fine tuned.

FINAL ADJUSTMENT

Idle Mixture: Start the engine and let it reach its normal operating temperature (3-5 minutes). Begin slowly turning the idle mixture screw in (clockwise). As you turn it in (clockwise), the engine will begin to falter, this is the lean drop off point.

NOTE

If the RPM is greater than 2,400 stop the procedure and reduce idle RPM. Settings above 2,400 will cause fuel from the main jet to contribute to the idle mixture creating an inaccurate idle mixture setting. Turn the needle out until the engine begins to falter. Note this position, this is the rich drop-off. Your final needle setting is halfway between the rich and the lean drop-off points. Once the mixture is set, the idle speed needs to be adjusted. Set the idle speed at the recommended RPM.

WALBRO CARBURETORS 4-CYCLE FIXED (WHG) (OH120 - 180)

On occasions high altitude has affected the operation of high and low speed performance. To correct this situation use the following steps:

1. Remove air cleaner assembly.
2. Remove choke shaft assembly.
3. Using an ice pick type tool with a small hook on the end, remove the brass cup plug out of the nozzle well vent.

NOTE

Do not use a thread tap as chips may enter the carburetor.

4. Reassemble choke shaft assembly.
5. Reinstall air cleaner assembly.

TROUBLESHOOTING

TecumsehPower CARBURETORS

Use the troubleshooting chart to determine the cause of a particular carburetor problem. Once the problem is identified, it will be necessary to select the proper corrective action.

Most repairs will consist of one of the following items:

1. At times it will be necessary to thoroughly clean the carburetor. First remove all welch plugs, adjustment screws, "O" rings and the needle and seat. After soaking the carburetor in a commercial cleaner for no longer than 30 minutes, use compressed air or a soft tag wire to clean passages.
2. If parts are worn or damaged, determine the extent of the damage. Check to see if the repair be made by just replacing parts or if the body of the carburetor is worn and in need of replacement.
3. Always replace throttle and choke shutter screws with new service screws (650506). New service screws have a dry adhesive on the threads. Replace all gaskets.

TROUBLESHOOTING

WALBRO WTA, WT, AND TILLOTSON HU DIAPHRAGM PUMP CARBURETORS

The Walbro and Tillotson diaphragm pump carburetors operate similarly by using a diaphragm impulse fuel pump and a diaphragm / needle metering system. The most common problems associated with these carburetors will be found in these two areas.

Fuel Pump. The fuel pump is normally trouble-free, but some problems that may arise are:

1. The diaphragm check valve can become stuck in place by fuel deposits such as gum and varnish. This would stop the flow of fuel through the carburetor.
2. The ribs on the face of the cover can become damaged through misuse and will allow the pump to leak.
3. The smooth machined surface where the check valves seat can get scratched or nicked, again causing the pump to leak.

METERING SYSTEM

The metering system is made up of four main parts:

1. Metering Diaphragm
2. Metering Lever
3. Metering Spring
4. Metering Needle

Some of the problems that could occur in this system are:

1. The diaphragm is damaged or torn resulting in a failure to allow fuel to flow from the pump to the metering side of the carburetor.
2. The diaphragm gets hard or stiff from stale fuel, slowing its response time and causing the engine to starve for fuel at high speeds.
3. The metering lever can be improperly adjusted causing a rich or lean running condition.

4. The metering spring can be damaged or the wrong spring installed affecting the acceleration and deceleration characteristics of the engine.
5. The metering needle, or its seat, could be worn causing fuel under pressure from the pump to bypass and flood the engine.

To troubleshoot the complete carburetor system, refer to the Carburetor Troubleshooting Charts in this book.

SERVICE CARBURETOR INFORMATION

To identify a carburetor for replacement on an engine, use the model and specification number of the engine. If the engine model and specification number are not present for some reason, there is a model and code date number stamped on the body of every carburetor.

With the model number, you will be able to find all of the information needed to repair or replace the carburetor. In the Master Parts Manual or the microfiche carburetor section, locate the manufacturing to service number cross reference list. Find the service part number listed for the carburetor. It will also list the page or grid where the carburetor breakdown can be found.

170	631215	70	233	631316
171	631218	70	234	631313

When referencing the carburetor in the price list, the original carburetor may be superseded to a service carburetor. Some TecumsehPower service carburetors will not have the fuel fitting. These carburetors can be identified by the description listed as SVC Carb NF, meaning service carburetor, no fitting. If this designation is not made in the listing, the carburetor will have a fuel fitting.

SERVICE CARBURETOR INFORMATION

(CONTINUED)

When the price list supersedes the original carburetor you are ordering to a service carburetor, you will need to identify the parts not included on the service carburetor. To determine these parts, turn to Division 5, Section A in the Master Parts Manual or the appropriate microfiche card listed under "carburetor." The information can be found under the title "List of parts required to build a complete carburetor from a standard service carburetor."

The cross section shown below uses 631211 as the original carburetor number. The price list supersedes that number to 631790A which is a service carburetor. The items shown following the number must be added to the service carburetor to make it a complete carburetor. Parts may be used from the original carburetor if they are in good condition. NEVER REUSE THE ORIGINAL THROTTLE AND CHOKE SHUTTER SCREWS.

NOTE

Since the mid 1980's TecumsehPower has discontinued the practice of establishing new service carburetors.

USING THE COMPUTER PARTS LOOK UP SYSTEM

Computer parts look up systems are fast, efficient and allow you to use several different options when looking up parts. If you know the part or manufacturing number of the carburetor you can use that number to access information to provide you with a parts list, artwork, availability and pricing. One method of obtaining the carburetor part number requires you to know the engine model number. This is not always available and could cause your customer some inconvenience having to return home to retrieve that information from the engine. If the customer has the carburetor along, you simply need to locate the manufacturing number on the carburetor and enter that number into the look up system. The following steps will direct you through the procedures needed to use either parts look up system.

PartSmart™

In this system the carburetor manufacturing number is considered an assembly. All assemblies are considered models and can be found under the **Model Inquiry** selection on the main menu. Click on the Model Inquiry Icon. Type the manufacturing number in the name box. This will automatically scroll the information on the screen. Click on the bar listing the information you have selected to view artwork and a parts list.

FLOAT ADJUSTMENT PROCEDURE

FLOAT HEIGHT SETTINGS

Proper float setting will require the use of TecumsehPower tool part number 670377 or a 11/64" drill bit. The procedure for setting the float height is as follows. Remove the bowl gasket, then hold the carburetor in the inverted position. Place the tool across the carburetor body opposite and parallel to the float hinge pin. Adjust the float height by bending the tab on the float until it touches.

CARBURETOR SERVICE TIPS

SERVICING THE SEAT

TecumsehPower carburetors are built with removable seats made out of a material called VITON®. These seats are easily removed by using TecumsehPower tool 670377 or by bending the end of a paper clip or wire with a 3/32" hook. Push the hook through the hole in the center of the seat and remove it. Never reuse the old seat, always replace with a new seat.

To install a new seat, make sure the seat cavity is clean, then moisten the seat with a drop of oil to help it slide into place. Position the seat with the grooved side of the seal down and carefully push the seat into its cavity with a 5/32" flat punch until it bottoms out. TecumsehPower tool 670377 can also perform this job.

INSTALLING INLET NEEDLE & FLOAT

Reinstall the inlet needle and the float into the carburetor. Make sure the long end of the clip on the inlet needle points toward the air intake (choke) end of the carburetor.

INSTALLING THE FLOAT BOWL

Install the float bowl by placing the detent portion opposite of the hinge pin. Make sure the deepest end of the bowl is opposite of the inlet needle. The bowl has a small dimple located in the deepest part. The purpose of this dimple is to minimize the chances of the float sticking to the bottom of the bowl caused by stale fuel.

CARBURETOR SERVICE TIPS (CONTINUED)

FLOAT BOWL SERVICE - VECTOR AND SERIES 7

To remove the float, take a needle nose pliers and grasp the cross piece between the center leg and the pivot point on the float. It is critical to pull the float straight out so as not to break it. To install the float, place the float hinge pin into the hinge slot on the float and press into place in the bowl.

Some bowls may also contain a clip or retaining ring, used to hold the seat in place. This is pre-installed as needed in the manufacturing process.

To make assembly easy, an alignment notch has been placed on the gasket and the bowl to guarantee proper location of the gasket.

ASSEMBLY OF MAIN MIXTURE SCREW

When reassembling the main mixture adjusting screw, position the coil spring on the screw first, followed by the small brass washer, then the rubber "O" ring seal.

REMOVAL AND INSTALLATION OF WELCH PLUGS

To perform a proper cleaning, all welch plugs should be removed to expose drilled passages. To remove the welch plug, sharpen a small chisel to a sharp wedge point. Drive the chisel into the welch plug, push down on chisel, and pry out of position.

A new welch plug should be installed bell-up as in the illustration. Using a punch equal or greater than the size of the plug, tap down onto plug. Do not dent or drive the center of the plug below the top surface of the carburetor. After installation of the welch plug, seal the outside edge of the plug with nail polish to ensure that air will not enter the mixing well, and that fuel will not leak out. Nail polish is resistant to fuel. Using different colors for each technician will identify the work of the previous repair person.

FUEL INLET FITTING

If necessary, this fitting can be removed by pulling and twisting. Be sure to install in the same position as the original. Some diaphragm carburetors have a strainer as an integral part of the fitting. If the strainer is lacquered or cannot be cleaned, replace the fitting. When installing a fitting, insert the tip into the carburetor body. Coat the exposed portion of the shank with Loctite grade A, then press it in until the shoulder contacts the carburetor body.

CARBURETOR SERVICE TIPS

(CONTINUED)

INLET FITTING REMOVAL

To remove a leaking or damaged fuel inlet fitting, use a 1/4" bolt, 1/4" nut and 1/4" washer, along with a 1/2" nut. Use a pliers or vise to remove the plastic part of the inlet fitting. Tap the inside of the remaining metal portion of the fitting using a 1/4"-20 tap. Place a 1/2" nut over the fuel fitting (it may be necessary to guide one side of the nut to seat it squarely to the carburetor). Next thread the 1/4" nut on the bolt until it contacts the shank, add the washer, and thread the bolt into the fitting until snug. Tighten the 1/4"-20 nut until the fitting is removed.

PROPER INSTALLATION OF CHOKE AND THROTTLE PLATES ON TecumsehPower CARBURETOR

Place choke plate into air horn of the carburetor. Make sure the flat surface is facing down. Choke plates can operate in both directions, however, each carburetor is designed to operate only one way. Make sure it is assembled properly for your engine.

NOTE

Always use a new screw(s) when reinstalling choke or throttle shutter. NEVER reuse old screw(s).

THROTTLE PLATE SERVICE

When installing the throttle plate on the 2 - 7 hp carburetor, position the plate with scribe mark facing out and in the 12 o'clock position.

NOTE

Make sure with all carburetors that binding does not occur.

When installing the throttle plate on the 8 - 17 hp carburetor, position the plate with scribe mark facing out and in the 3 o'clock position.

NOTE

Make sure with all carburetors that binding does not occur.

CARBURETOR SERVICE TIPS (CONTINUED)

DIAPHRAGM CARBURETOR "F" DESIGNATION

If the carburetor has an "F" designation on the casting, it will identify the installation sequence of the gasket and diaphragm on the carburetor. "F" designated carburetors have the diaphragm installed first then the gasket then the cover. If there is no designation, the sequence is then gasket, diaphragm and cover.

SERVICEABLE EMULSION TUBES

Some carburetors use a serviceable emulsion tube sealed with "O" rings on one or both ends. When servicing these carburetors, the "O" ring(s) on the emulsion tube needs to be removed. During the removal of the tube the "O" ring on the venturi end of the tube may remain stuck in the center leg of the carburetor. This "O" ring must be removed and replaced to guarantee proper sealing and operation. To remove the tube bend a 90° hook in a paper clip or stiff wire. Reach in the venturi and push the main nozzle emulsion tube out as far as possible. Hook the wire into the air bleed hole and pull out to remove. Make sure all "O" rings have been removed and placed on the main nozzle emulsion tube before reinstalling the tube.

VECTOR AND SERIES 7 EMULSION TUBE SPRING

The emulsion tube spring in the Vector and Series 7 carburetor is used to put tension on the tube forcing it towards the gasket. This seals the tube, preventing unmetered air from entering the center leg. The proper sequence is float bowl spring, tube, gasket and carburetor body. To remove the emulsion tube, gently grab the tube with a needle nose pliers and pull straight out. If the tube is damaged or distorted replace it.

HOT RESTART

Occasionally, on engines equipped with the dual system carburetor, some rich starting conditions have occurred when the engine is warm. This can be corrected using the white plastic spacer as shown and inserted in the center leg of the carburetor. (Service # 632158). This spacer is designed to reduce the amount of prime charge in the main nozzle area for better starting under warm engine conditions. It can only be used on Dual System carburetors and does not lean out the carburetor mixture.

PRIMER BULB SERVICE

PRIMER BULB IDENTIFICATION

Care must be used when replacing carburetor primer bulbs. Using the wrong primer bulb could cause hard starting or non-starting problems. Currently, TecumsehPower uses four different carburetor mounted primer bulbs. To avoid problems, use the Master Parts Manual for the correct application.

The five primer bulbs currently used feature two different shapes; derby and stepped (or hourglass) and two different venting types; internal or external.

STEPPED PRIMER BULBS

A stepped primer bulb is used to force a charge of air into the bowl through the atmospheric vent chamber. The sealing surface as pictured prevents air from going back into the air filter.

NOTE

Bowl prime systems require a good gasket seal on the bowl or a low prime charge will be generated.

CAUTION To avoid serious eye injury, wear safety glasses or goggles when removing retainer.

To remove the primer bulb, grasp the bulb with a pliers, pulling and twisting it out of its body. After removing the primer bulb, the retaining ring must be removed. Use a screwdriver to carefully pry the retainer out of the body. Do not reuse old primer bulb or retainer.

After the primer bulb is removed, clean the primer passages thoroughly.

Press the new bulb and retainer into position using a deep reach socket.

NOTE

New primer bulbs come with a new retaining ring.

FUEL FILTERS

TecumsehPower engines use some form of filtration prior to the carburetor. When a non-TecumsehPower tank is used, an in-line fuel filter between the tank and carburetor is required. The filters use a 75 micron fibrous paper to trap even the smallest particles of dirt while maintaining the same flow rate. An arrow showing the direction of flow is molded into the body of the filter to aid in installation.

FUEL TANK FILTERS

All fuel tanks provided by TecumsehPower have a 75 micron stainless steel filter screen molded right into the tank over the fuel outlet. On TC series engines, a fuel filter is located on the fuel line in the tank. These filters can become restricted when foreign debris enters the tank or when varnish and gum deposits form due to stale fuel. Be sure to check these areas if you have a fuel flow problem.

INTERNAL ATMOSPHERIC VENT PASSAGE

INTERNAL ATMOSPHERIC VENT PASSAGE (FLOAT STYLE CARBURETOR). Some internally vented float style carburetors will use a tygon tube within the air cleaner. This tube must be present for the carburetor to operate properly.

FAILURE ANALYSIS

DAMAGED IDLE OR MAIN MIXTURE ADJUSTING NEEDLES.

Mixture adjusting needles have a critical taper on the end that is easily damaged from overtightening or abuse. Check these parts if your carburetor is difficult to adjust.

WATER CONTAMINATION

Water contamination in the fuel system causes oxidation and rust on the component parts. Once the oxidation process starts it is irreversible; the carburetor must be replaced.

GUM AND VARNISH

When the fuel is not completely drained from the system during prolonged storage, the most volatile parts of the fuel begin to oxidize and evaporate. This leaves the crude portion of the fuel to remain and forms into resin, gum, and varnish which will restrict and clog the fuel

system's passages.

FAILURE ANALYSIS (CONTINUED)

WORN THROTTLE AND CHOKE SHAFTS

When operating in a dirty or sandy environment, these areas can wear rapidly causing erratic performance. Some shafts have been plated and dust shields have been added to retard this wear. This is done based on the application needs. Keeping these areas free from dirt and grit will extend the life of the carburetor.

CRUSHED FLOAT

A crushed float will sink to the bottom of the carburetor bowl holding the inlet valve open and causing the engine to flood. This condition is caused either from water in the fuel bowl freezing during extreme cold temperatures or by blowing compressed air directly into the fuel inlet while the carburetor is assembled.

WORN HINGE PIN

The hinge or hinge pin can wear excessively from dirt or foreign matter in the fuel system. These worn areas will cause a sticky or binding float which will result in either a flooded or starved engine.

FAILURE ANALYSIS

(CONTINUED)

WORN NEEDLE AND SEAT

This is another area that can wear rapidly from dirt or foreign matter in the fuel system. This condition creates a poor seal at the seat area causing the carburetor to flood or the engine to run rich. This can also cause the needle to stick in the seat which will stop the flow of fuel.

WORN CARBURETOR BODY

If throttle shafts are plated, operation in a dirty or sandy environment will tend to cause wear to the carburetor body in the shaft area. Excessive wear in this area will cause erratic engine performance or a binding throttle plate. Again, to avoid this situation, clean these areas regularly and keep them free from dirt and grit.
